Participating Organizations: Curious & Connected NPO, Bubbles & Café Inc.

Synopsis:

The future of quantum computing and quantum sensing technologies hinges on the development of advanced materials with tailored properties. One of the key materials of interest is nanocrystals, which exhibit unique quantum properties. This proposed project aims to break new ground by synthesizing tailored nanocrystals for achieving optimal performance in spin qubits and quantum sensors. It leverages the optimization of fluid dynamics in microgravity and combines the principles of spintronics to advance quantum materials science.

Program Objectives

- To design and construct an innovative microgravity-based reaction vessel for precise control of fluid dynamics.
- To leverage spintronics for controlling the synthesis process.
- To develop cutting-edge synthesis methods for nanocrystals with tailored properties.
- To explore the integration of these nanocrystals into spin qubits and quantum sensors.
- To validate the enhanced performance of quantum devices utilizing tailored nanocrystals.

Research Areas

1. Microgravity Reaction Vessel

Bubbles & Cafe Inc, Curious & Connected NPO

NQVL : QSTD : Pilot : Synthesizing Tailored Nanocrystals for Optimal Spin Qubit and Quantum Sensor Performance

PI: ILAKKUVASELVI MANOHARAN

- Design and build a cutting-edge microgravity reaction vessel.
- Utilize fluid dynamics optimization, spintronics, and quantum sensors.
- Enable controlled microgravity synthesis of nanocrystals.
- Advance materials science possibilities.

## 2. Nanocrystal Synthesis

- Develop specialized synthesis techniques for microgravity.
- Precisely engineer nanocrystals with desired properties.

## 3. Spintronics Integration

- Integrate nanocrystals into spintronics-based quantum devices.
- Focus on spin qubits and quantum sensors.
- Investigate compatibility and performance enhancements.

## 4. Performance Validation

- Test and benchmark quantum devices.
- Explore real-world applications in quantum computing and sensing.

## Expected Outcomes

- The development of a cutting-edge microgravity-based reaction vessel leveraging fluid dynamics optimization and integration of spintronics
- Innovative synthesis methods for nanocrystals with precisely tailored properties.
- Enhanced performance of quantum devices, including improved qubit coherence times and sensitivity of quantum sensors, through the use of tailored nanocrystals.
- The potential for transformative advancements in quantum technology.
